| Students / Estudiantes              | Valeria Patricia Contreras Miranda<br>Marjory Lizbeth Lima Lima<br>Tatiana Lissett Menéndez Mercado<br>Alisson Jazmín Peña Cortéz |
| Grade and section / Grado y sección | 3° Software Development "A"                                                                                                       |
| Project / Proyecto                  | HABIT LOOP — Habit Tracker                                                                                                        |
| Environment / Entorno               | PHP                                                                                                                               |
| IDE and version                     | Visual Studio Code                                                                                                                |
| Date / Fecha                        | 2026-09-01                                                                                                                        |
| Teacher / Docente                   | Ing. Javier Arturo García Mineros                                                                                                 |

## 1. Purpose of the application

This web application helps users build and maintain daily habits using a simple PHP backend. Users can add habits, mark them as completed each day, and track their daily streaks. It is designed for anyone who wants a straightforward tool to improve their daily routines on mobile or desktop devices.

*Esta aplicación web ayuda a los usuarios a crear y mantener hábitos diarios usando un backend sencillo en PHP. Los usuarios pueden agregar hábitos, marcarlos como completados cada día y ver sus rachas diarias. Está diseñada para cualquier persona que busque una herramienta simple para mejorar sus rutinas desde el teléfono o la computadora.*

## 2. User stories

| # | AS A ... I WANT ... SO THAT ...                                                              | ACCEPTANCE CRITERIA                                                                      |
|---|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| 1 | As a user, I want to create a new habit so that I can start tracking it.                     | The user enters a habit name and target days per week, and it saves to the system.       |
| 2 | As a user, I want to check off a habit today so that I can keep track of my progress.        | Clicking a checkbox marks the habit as done for today and updates the record instantly.  |
| 3 | As a user, I want to see my current streak so that I stay motivated every day.               | The system calculates consecutive completed days and shows the total streak number.      |
| 4 | As a user, I want to edit or delete a habit so that I can keep my list updated.              | The user can change the habit name or remove it completely from the list.                |
| 5 | As a user, I want to see my weekly completion rate so that I know how well I am doing.       | The app shows a progress percentage based on completed days vs target days for the week. |
| 6 | As a user, I want to view the app on my phone and PC so that I can check my habits anywhere. | The layout adapts cleanly to small mobile screens and desktop browsers.                  |

## 3. Screens and controls

| SCREEN OR VIEW        | CONTROLS (NAMED IN ENGLISH)                                                    | WHAT THE USER DOES THERE                                                              |
|-----------------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Dashboard / Main View | HabitListTable, CheckCompletedButton, AddHabitButton, StreakBadge, ProgressBar | Checks off habits completed today, views daily streaks, and clicks to add new habits. |
| Add / Edit Habit Form | HabitNameInput, TargetDaysDropdown, SaveHabitButton, CancelButton              | Creates a new habit or updates an existing one with its weekly target goal.           |
| Weekly Progress View  | SevenDayGrid, WeeklyPercentageLabel, BackButton                                | Reviews weekly completion history and checks the overall progress percentage.         |

|                              |                                                                  |                                                                          |
|------------------------------|------------------------------------------------------------------|--------------------------------------------------------------------------|
| Settings /<br>Reminders View | ThemeToggleSwitch, NotificationTimePicker,<br>SaveSettingsButton | Toggles dark/light theme and configures<br>daily reminder notifications. |
|------------------------------|------------------------------------------------------------------|--------------------------------------------------------------------------|

## 4. Data model

| CLASS        | FIELDS AND TYPES                                                               | WHERE THE DATA LIVES (MEMORY / FILE)                                      |
|--------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Habit        | Id (int), Name (string), TargetPerWeek (int),<br>CompletedDates (array / text) | Saved in JSON file on server or MySQL<br>database (PHP local persistence) |
| UserProgress | HabitId (int), CurrentStreak (int),<br>WeeklyPercentage (float)                | Computed in PHP memory during runtime /<br>server data storage            |
| UserSettings | Theme (string), NotificationEnabled (bool),<br>ReminderTime (string)           | Toggles dark/light theme and configures daily<br>reminder notifications.  |

## 5. Setup log

| STEP                    | COMMAND OR ACTION                          | RESULT                                       | PROBLEM FOUND AND HOW YOU SOLVED IT                                      |
|-------------------------|--------------------------------------------|----------------------------------------------|--------------------------------------------------------------------------|
| Install /<br>verify SDK | php -v                                     | Displays PHP 8.x installed<br>version        | Path variable not set. Added PHP<br>directory to Environment Variables   |
| Create<br>project       | mkdir habit-loop && cd<br>habit-loop       | Project folder created<br>successfully       | None.                                                                    |
| First run               | php -S localhost:8000                      | Local server started at<br>localhost:8000    | Port 8000 in use. Switched command to<br>run on port 8080.               |
| Folder<br>structure     | Created folders: /config,<br>/public, /src | Folder layout ready for<br>code organization | Wrong folder permissions. Adjusted<br>write permissions for data folder. |

## 6. Risks

---

Risk 1: User data could be lost if the JSON file corrupts. Fix: Create automatic daily JSON backups in PHP.

Risk 2: App might look broken on mobile screens. Fix: Test with CSS Media Queries to keep layout responsive.

Risk 3: Streak math calculated incorrectly across months. Fix: Use built-in PHP DateTime functions to compare dates correctly.

*Riesgo 1: Pérdida de datos si el archivo JSON se daña. Solución: Crear respaldos automáticos del JSON con PHP.*

*Riesgo 2: Se puede ver mal en teléfonos. Solución: Probar el diseño con Media Queries en CSS para adaptarlo a móviles.*

*Riesgo 3: Errores al calcular rachas al cambiar de mes. Solución: Usar las funciones nativas DateTime de PHP para comparar fechas correctamente.*

**Evidence:** attach screenshot EV-01 showing the empty project running, and the content of your README.md file.

*Adjunte la captura EV-01 con el proyecto vacío en ejecución y el contenido de su README.md.*
