

UI & MODEL

SPECIFICATION SHEET

Build It in English · Day 2

Hoja de especificación de interfaz y modelo · Día 2

Student / Estudiante	Valeria Patricia Contreras Miranda Marjory Lizbeth Lima Lima Tatiana Lissett Menéndez Mercado Alisson Jazmín Peña Cortéz
Project / Proyecto	HABIT LOOP — Habit Tracker
Environment / Entorno	PHP
Accent colour / Color de acento	#22D3EE
Fonts / Tipografías	Inter, Roboto, sans-serif
Date / Fecha	2026-09-01

1. Interface controls

SCREEN	CONTROL NAME	TYPE	TEXT SHOWN TO THE USER	WHAT IT WILL DO
Dashboard	AddHabitButton	Button	+ Add New Habit	Opens the form to create a new habit.
Dashboard	CheckCompletedCheckbox	Checkbox	Done	Marks the selected habit as completed for today.
Add / Edit Habit	HabitNameInput	Text Input	Enter habit name...	Accepts the title of the habit from the user.
Add / Edit Habit	TargetDaysDropdown	Dropdown	Days per week	Lets the user select the target frequency per week.

Add / Edit Habit	SaveHabitButton	Button	Save Habit	Saves the new habit or changes to the database.
Settings	ThemeToggleSwitch	Switch / Toggle	Dark Mode	Toggles between dark and light themes for the UI.

2. Microcopy inventory

SITUATION	TEXT IN ENGLISH	COPIA EN ESPAÑOL (SOLO PARA EL INFORME)
Empty state	No habits created yet. Click "+ Add New Habit" to get started!	Aún no hay hábitos creados. ¡Haz clic en "+ Agregar nuevo hábito" para comenzar!
Validation error 1	Please enter a habit name.	Por favor ingresa el nombre del hábito.
Validation error 2	Please select target days per week (between 1 and 7).	Por favor selecciona los días meta por semana (entre 1 y 7).
Delete confirmation	Are you sure you want to delete this habit? This cannot be undone.	¿Estás seguro de que quieres eliminar este hábito? Esto no se puede deshacer.
Success message	Habit saved successfully!	¡Hábito guardado con éxito!
No search results	No habits found matching your search.	No se encontraron hábitos que coincidan con tu búsqueda.

3. Model classes

CLASS	FIELD	TYPE	WHAT IT STORES	VALIDATION RULE
Habit	id	int	Unique habit identifier	Required, auto-increment integer

Habit	name	string	Name of the habit	Required, non-empty, max 100 characters
Habit	targetPerWeek	int	Target goal days per week	Required, integer between 1 and 7
Habit	completedDates	array	Dates when habit was completed	Array of valid YYYY-MM-DD date strings
UserSettings	theme	string	UI color mode selection	Required, must be 'dark' or 'light'
UserSettings	reminderTime	string	Daily reminder time	Valid HH:MM time format

4. Methods planned

METHOD SIGNATURE (ENGLISH)	WHAT IT DOES	WHERE IT IS CALLED FROM
addHabit(string \$name, int \$targetPerWeek): bool	Creates a new habit record and saves it to the database or JSON file.	Called from the SaveHabitButton click event in the habit form.
markCompleted(int \$habitId, string \$date): bool	Marks the specified habit as done for the given date and updates the streak.	Called when the user checks off a habit in the Dashboard (CheckCompletedCheckbox).
calculateStreak(int \$habitId): int	Computes the current consecutive days the habit has been completed.	Called by the Dashboard view to display the StreakBadge.
getWeeklyProgress(int \$habitId): float	Calculates the percentage of completed days versus target days for the current week.	Called by the Progress view to show the ProgressBar.
deleteHabit(int \$habitId): bool	Removes a habit and all associated logs permanently from storage.	Called from the delete button in the habit edit modal or list item.

5. Problems and solutions

During development today, we ran into an issue where calculating habit streaks failed when crossing over into a new month. We fixed this by switching from standard string comparisons to PHP's built-in DateTime object methods, which accurately compute consecutive days regardless of calendar month boundaries. Additionally, we fixed a JSON write permission error by updating server folder permissions for the data directory.

Durante el desarrollo de hoy, tuvimos un problema al calcular las rachas de hábitos cuando los días cambiaban de un mes a otro. Lo solucionamos cambiando la comparación simple de texto por el uso de los métodos de la clase DateTime nativa de PHP, los cuales calculan los días consecutivos de forma exacta sin importar los límites del calendario. Además, corregimos un error de permisos de escritura en el servidor ajustando los accesos a la carpeta de datos.

Evidence: attach screenshot EV-02 of the finished interface and paste one model class with its comments.

Adjunte la captura EV-02 de la interfaz terminada y pegue una clase del modelo con sus comentarios.
